

Your data stays yours

Export, delete, and ownership rights explained plainly.

A user should never feel trapped by their own history

Data ownership is not only a legal phrase. It is a product behavior. A user should be able to leave, export, or delete their data without needing to negotiate with the interface.

For a product about focus and judgment, that clarity matters especially. The user is the subject, not the inventory.

Export

Your history should be portable

Export gives users continuity and accountability. It lets them inspect the patterns a product stores and move that history if they choose.

A plain export is also a forcing function for honest data design: if a user reads it, it should make sense.

Delete

Deletion should mean deletion

A privacy-first product should make deletion clear, predictable, and complete within the limits required for security, fraud prevention, and legal records.

The goal is simple: the user should know what remains, why it remains, and when it expires.
